

A man working for Movin is a man who can help you solve any problems you might have with handling and automation. The professionalism, the skills and the personal experience gained over the years in satisfying the specific needs of various business matters are guarantee to obtain excellent results even for the future.

Movin aims to offer its customers a reliable partnership, which is technologically competent and ready to collaborate efficiently and cordially during each phase of the job:

- from the examination of the logistic situation and of the specific needs to the use of alternative technologies offered by Conveyors.
- from the elaboration of the first project hypothesis and feasibility studies to the installation and testing of the plants.

Methodologies of actions continuously perfected, a prompt global assistance and the availability of skilled staff for the updating and maintenance of the plants, are the outcome of a corporate philosophy completely oriented to the concept of total quality: the consistency of the service towards the client and its undeniable condition for industrial systems at a very high technological content.

MISSION

MOVIN SPA operates in the field of planning, production, supply and installation of plants for the transport and the handling.

The experience in all productive fields, enables us to be a valid support to Your management in the choice of the best solutions for each different plant. We supply plants, in the turnkey formula or preassembled modules, that solve problems relative to the handling and the storage of goods inside a productive process, looking at the efficiency and the reduction of costs.

- On floor conveyors with flying roller chains or flat chains allow us to develop flexible systems. They are used every time it is necessary to handle and work with products transported on pallets in a fast, precise, reliable, silent way achieving series or parallel working areas.

- Rollers conveyors are mainly used when it is necessary to handle and work products without supporting pallets or polystyrene and/or paperboard bases or products gathered on wood pallets.

- Belt conveyors make it possible to create light transport systems, having the flexibility and modularity characterising Movin products. They are used every time it is necessary to handle products without pallets, in a precise, reliable, fast and noiseless way.

- Power & Free Conveyors are systems able to solve very complex problems of mechanical handling, such as interconnection between two or more working areas which are operating according to different timing.

- Overhead and up-turned monorail conveyors can solve the simplest conveyance and storage problems by connecting two or more similar-paced workstations.
